

RaphCare progress (partner view)

This is the **simple** status board. Same topics as the engineering checklist, without code names.

PDF: [raphcare-feature-checklist-partner.pdf](#)

Engineering detail (APIs, files, checkboxes for builders): [raphcare-feature-checklist.md](#)

How to read this

- **Done:** you can use it today (in admin web, patient app, or both as noted).
- **Partial:** something works, but a piece is missing or only works on one phone type.
- **Not started:** not built yet (or not planned for that product surface).
- **Not for mobile:** staff/admin work stays in the web admin panel on purpose.

Last reviewed: 2026-07-18

1. Hospital admin (outpatient)

What staff do in the **web admin panel** for day-to-day clinic work (not overnight beds).

Area	Status	What you can do
Hospital list, register, claim	Done	Find or register a hospital
Hospital profile and facilities	Done	Edit details; add physical or virtual locations
Staff invites and roles	Done	Invite people; set admin vs staff
Patients at a hospital	Done	Grant or remove access; open patient detail
Providers and schedules	Done	Add providers; manage schedules
Appointments	Done	Book, cancel, reschedule
Visits and vitals	Done	Start a visit; record vitals; complete
Video join for staff	Done	Start a tele session from admin
Dashboard numbers	Done	See clinic metrics
Same tools inside the patient phone app	Not for mobile	Patients use the app; staff use the web admin

Bottom line: outpatient hospital admin is ready on the web.

2. Inpatient (wards, beds, admit / discharge)

Overnight stays: set up rooms and beds, put a patient in a bed, discharge them.

Area	Status	What you can do
See bed board (how many free / full)	Done	Open Inpatient on a hospital in admin
Add ward, room, bed	Done	Admins can create capacity
Admit a patient to a bed	Done	Pick a patient and an available bed
Discharge (free the bed)	Done	End an active stay
Edit or remove wards / rooms / beds later	Not started	Create only for now
Mark a bed "maintenance"	Not started	Status exists in the design, not in the screens yet
Move a patient to another bed	Not started	
Past admission history	Not started	Active stays only today
Same board in the phone app	Not for mobile	Unless we later build a clinician app

Bottom line: basic inpatient is usable in admin web. Richer bed management still to come.

3. Patient phone app

What patients see on Android / iPhone.

Screens and features

Area	Status	Notes
Sign up / sign in (email, phone code, voice)	Done	
Home and navigation	Done	Some areas can be turned off with feature flags
Appointments (list, book, detail)	Done	
Care / request a call / join video	Partial	Video call works on Android ; iPhone video still needs more setup
Health records	Done	
Insurance	Done	
Billing / payment methods	Done	
Family members	Done	
Mental health (mood check-in)	Done	
Chat assistant	Partial	Works; real smart replies need cloud AI keys in production
Notifications list	Done	Real push alerts need Firebase / store setup

Settings and profile	Done	
----------------------	------	--

Phones and devices (broader coverage)

Area	Status	Notes
Run on Android phones	Done	Main day-to-day test target
Run on iPhone	Partial	App can target iOS; full release checks still open
Same feature checked on both Android and iPhone before "ready"	Not started	Use the release checklist when locking a release
Video visit on a real Android phone	Partial	Wiring is in; confirm on hardware
Video visit on a real iPhone	Not started	Needs iOS video kit wiring
Push alerts on Android	Partial	Needs Firebase configured on the server
Push alerts on iPhone	Partial	Needs store / push setup + a real device test
Connect E580 / E585 style Bluetooth bands	Partial	Scan, connect, heart rate when the band supports it; offline retry exists
Full vendor band SDK (HBand)	Not started	Documented path; not finished in the app
Y6 Pro emergency 4G watch flow	Partial	Product plan exists; app path thinner than the Bluetooth bands
Windows PC build of the app	Not for BLE	Bluetooth patient devices are for phones, not the Windows target

Bottom line: the patient app screens are largely there. Catch-up work is mostly **iPhone video**, **real push**, **wearables depth**, and **testing the same flows on both phone types**.

4. Other staff / system pieces

Area	Status	Notes
Core clinical and patient APIs	Done	Power the app and admin
FHIR export	Done	For interoperability
Emergency webhook	Done	Integration hook
Staff mental-health assessment store	Partial	List exists; deeper storage later
Reporting / big dashboards	Partial	Grows with product needs

What to try this week (partner)

1. **Admin web:** open a hospital -> Inpatient. Add a ward/room/bed if needed, admit someone, discharge them.
 2. **Admin web:** book an appointment and start a visit (outpatient path).
 3. **Patient app on Android:** sign in, open Home, try Appointments and Devices (Bluetooth band if you have one).
 4. **Patient app on iPhone (if available):** same smoke test; note anything that fails (especially video).
