

# RaphCare progress (partner view)

This is the **simple** status board. Same topics as the engineering checklist, without code names.

PDF: [raphcare-feature-checklist-partner.pdf](#)

Engineering detail (APIs, files, checkboxes for builders): [raphcare-feature-checklist.md](#)

**Overall completion: 75%**

## How to read this

- **Done** = 100% of that row
- **Partial** = 50%
- **Not started** = 0%
- **Not for mobile** / **Not for clinical v1** / **Not for BLE** = left out of the % on purpose
- **Later** notes (phone use of the web admin, and similar) are left out of the % until we schedule the work
- Section % = average of that section's scored rows
- Overall % = average of all scored rows in sections 1-4

Each section shows its % in the heading. Numbers stay in sync with the engineering checklist when status changes.

---

## 1. Hospital admin (outpatient) - 100%

---

What staff do in the **web admin panel** for day-to-day clinic work (not overnight beds).

| Area                            | Status | What you can do                                                                                                                             |
|---------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Hospital list, register, claim  | Done   | Find or register a hospital. Each hospital gets a short RaphCare reference staff can share.                                                 |
| Opening a hospital              | Done   | The left menu hides so the hospital tools have more room. Use All hospitals in the top bar to go back. Language and sign out are there too. |
| Hospital profile and facilities | Done   | Edit details; add physical or virtual locations. The same card layout is used on other hospital screens.                                    |
| Staff invites and roles         | Done   | Invite people; set admin vs staff                                                                                                           |
| Patients at a hospital          | Done   | Grant or remove access; open patient detail                                                                                                 |
| Providers and schedules         | Done   | Add providers; manage schedules                                                                                                             |
| Appointments                    | Done   | Book, cancel, reschedule                                                                                                                    |

|                                                   |                |                                               |
|---------------------------------------------------|----------------|-----------------------------------------------|
| Visits and vitals                                 | Done           | Start a visit; record vitals; complete        |
| Video join for staff                              | Done           | Start a tele session from admin               |
| Dashboard numbers                                 | Done           | See clinic metrics                            |
| Web languages (English, French, Lingala, Swahili) | Done           | Change language in the admin portal           |
| Same tools inside the <b>patient phone app</b>    | Not for mobile | Patients use the app; staff use the web admin |

**Bottom line (100%):** outpatient hospital admin is ready on the web. Opening a hospital hides the left menu so staff can focus on that hospital.

**Later (not in this %):** staff should use this same web admin on a phone. Make the screens work on a small display first. A light home-screen shortcut can follow. A full offline installable web app is not the plan. Detail: [../15\\_Web\\_Admin\\_On\\_Phone.md](.. /15_Web_Admin_On_Phone.md).

---

## 2. Inpatient (wards, beds, admit / discharge) - 100%

---

Overnight stays: set up rooms and beds, put a patient in a bed, discharge them.

| Area                                      | Status         | What you can do                                                              |
|-------------------------------------------|----------------|------------------------------------------------------------------------------|
| See bed board (how many free / full)      | Done           | Open Inpatient on a hospital in admin. Use the left tabs to switch sections. |
| Add ward, room, bed                       | Done           | Admins can create capacity                                                   |
| Admit a patient to a bed                  | Done           | Search patients and pick an available bed                                    |
| Discharge (free the bed)                  | Done           | End an active stay with optional notes                                       |
| Edit or remove wards / rooms / beds later | Done           | Edit, deactivate, or delete; archives if history exists                      |
| Mark a bed "maintenance"                  | Done           | Toggle Available ↔ Maintenance on free beds                                  |
| Move a patient to another bed             | Done           | Transfer on the active admissions board                                      |
| Past admission history                    | Done           | Filterable history list with load more                                       |
| Same board in the <b>phone app</b>        | Not for mobile | Unless we later build a clinician app                                        |

**Bottom line (100%):** inpatient lifecycle is complete in admin web (capacity, maintenance, transfer, history).

---

## 3. Patient phone app - 58%

---

What patients see on Android / iPhone.

## Screens and features

| Area                                         | Status  | Notes                                                                           |
|----------------------------------------------|---------|---------------------------------------------------------------------------------|
| Sign up / sign in (email, phone code, voice) | Done    |                                                                                 |
| Home and navigation                          | Done    | Some areas can be turned off with feature flags                                 |
| Appointments (list, book, detail)            | Done    |                                                                                 |
| Care / request a call / join video           | Partial | Video call works on <b>Android</b> ; <b>iPhone video</b> still needs more setup |
| Health records                               | Done    |                                                                                 |
| Insurance                                    | Done    |                                                                                 |
| Billing / payment methods                    | Done    |                                                                                 |
| Family members                               | Done    |                                                                                 |
| Mental health (mood check-in)                | Done    |                                                                                 |
| Chat assistant                               | Partial | Works; real smart replies need cloud AI keys in production                      |
| Notifications list                           | Done    | Real push alerts need Firebase / store setup                                    |
| Settings and profile                         | Done    |                                                                                 |

## Phones and devices (broader coverage)

| Area                                                                  | Status      | Notes                                                                                                                         |
|-----------------------------------------------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| Run on <b>Android</b> phones                                          | Done        | Main day-to-day test target                                                                                                   |
| Host API + admin web for remote Android testers                       | Partial     | API and admin web App Services exist; admin web Staging settings point at the hosted API; finish deploy smoke and Play invite |
| Play Store internal test package id                                   | Partial     | Android id set to a stable Yindula id; upload via Play Console still needed                                                   |
| Run on <b>iPhone</b>                                                  | Partial     | App can target iOS; full release checks still open                                                                            |
| Same feature checked on <b>both</b> Android and iPhone before "ready" | Not started | Use the release checklist when locking a release                                                                              |
| Video visit on a real Android phone                                   | Partial     | Wiring is in; confirm on hardware                                                                                             |
| Video visit on a real iPhone                                          | Not started | Needs iOS video kit wiring                                                                                                    |
| Push alerts on Android                                                | Partial     | Needs Firebase configured on the server                                                                                       |
| Push alerts on iPhone                                                 | Partial     | Needs store / push setup + a real device test                                                                                 |

|                                                          |                     |                                                                                                                               |
|----------------------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Connect <b>E580 / E585</b> style Bluetooth bands         | Partial             | Scan includes ET580 / ET585 labels; heart rate / oxygen only when the band speaks standard Bluetooth health profiles          |
| Live heart rate and blood oxygen in the app              | Partial             | Android vendor path wired; confirm on your ET580 / ET585 samples                                                              |
| Auto sync and background monitoring                      | Not started         | Manual sync exists; background sync not finished                                                                              |
| Full band health history (like the vendor companion app) | Partial             | Connect and live HR/SpO <sub>2</sub> started; activity/sleep/history still open                                               |
| Activity (steps, calories, distance), sleep, stress      | Not started         | On the watches; not in RaphCare yet                                                                                           |
| Body temp, ECG, glucose-style screens from the band      | Not started         | Documented; clinical use of optical glucose stays gated                                                                       |
| Weather and lifestyle pushes to the watch                | Not for clinical v1 | Watch needs an app for weather; not a patient vital                                                                           |
| Full vendor band SDK (HBand) on Android                  | Partial             | Download libs + app bridge in place; hardware prove-out next                                                                  |
| Full vendor band SDK on iPhone                           | Not started         | Android first                                                                                                                 |
| <b>Y6 Pro</b> emergency 4G watch flow                    | Partial             | Webhook + SMS + <b>clinic patient chart</b> + hospital <b>Devices</b> emergency board; OEM mapping / push alerts still future |
| Windows PC build of the app                              | Not for BLE         | Bluetooth patient devices are for phones, not the Windows target                                                              |

#### Wearable feature list (survives changing watch models):

docs/14\_Wearable\_Capability\_Catalog.md

**Bottom line (58%):** the patient app screens are largely there. Catch-up work is mostly **iPhone video, real push, wearables depth** (live vitals, full sync, background), and **testing the same flows on both phone types**.

## 4. Other staff / system pieces - 80%

| Area                                 | Status  | Notes                             |
|--------------------------------------|---------|-----------------------------------|
| Core clinical and patient APIs       | Done    | Power the app and admin           |
| FHIR export                          | Done    | For interoperability              |
| Emergency webhook                    | Done    | Integration hook                  |
| Staff mental-health assessment store | Partial | List exists; deeper storage later |
| Reporting / big dashboards           | Partial | Grows with product needs          |

**Bottom line (80%):** core APIs and hooks are in; deeper mental-health storage and reporting grow with product needs.

---

## Rollup

---

| Area                           | %          | Notes                                           |
|--------------------------------|------------|-------------------------------------------------|
| 1. Hospital admin (outpatient) | 100%       | Ready on web                                    |
| 2. Inpatient                   | 100%       | Ready on web                                    |
| 3. Patient phone app           | 58%        | iPhone video, push, wearables                   |
| 4. Other staff / system        | 80%        | Storage and reporting polish                    |
| <b>Overall</b>                 | <b>75%</b> | Excludes "not for mobile / clinical / BLE" rows |

---

## What to try this week (partner)

---

1. **Admin web:** open a hospital. The left menu should hide. Use All hospitals in the top bar to return to the list.
  2. **Admin web:** on that hospital, open Inpatient. Add a ward/room/bed if needed, admit someone, discharge them.
  3. **Admin web:** book an appointment and start a visit (outpatient path).
  4. **Patient app on Android:** sign in, open Home, try Appointments and Devices (Bluetooth band if you have one).
  5. **Patient app on iPhone (if available):** same smoke test; note anything that fails (especially video).
