

RaphCare partner update (23 Aug 2026)

Here is a summary of what I did today on the public website, the hosted admin site, and the API. This is a hosting and wiring day, not a new clinical feature day.

1. Public website moved to the new Forge server

raphcare.com now runs on the new Forge server (server3.yindula.com), not the old DigitalOcean host.

What I did:

- Switched Afrihost nameservers so Afrihost controls DNS (it was still on DigitalOcean nameservers).
- Pointed the website A records (raphcare.com, www, and the wildcard) at the Forge IP.
- Left mail and cPanel records on Afrihost, so email stays where it is.
- Created the site on Forge, issued HTTPS (Let's Encrypt), and deployed the marketing site.

<https://www.raphcare.com> redirects to <https://raphcare.com>. The live page is the RaphCare marketing site, not the old WordPress maintenance page that was sitting on the previous server.

2. The admin site was talking to the wrong place

On the live admin website, clinic lists and email verification failed because the site was still trying to reach a copy of the API that only exists on a developer PC.

The hosted admin site is now set to call the hosted API:

<https://raphcare-api-eydjcnefhae2dpa2.southafricanorth-01.azurewebsites.net>

The admin site itself is:

<https://raphcare-hqf6gsa3acanargz.southafricanorth-01.azurewebsites.net>

Email settings on the API were already in place. They were not the reason verification failed. The website never reached the API, so no mail was sent.

3. The API could not stay running on Azure

Once the admin site pointed at the real API, I could see why the API itself was falling over.

- It was still trying to use a laptop-only database. That does not exist on Azure.
- The connection name on Azure was then corrected so the API uses Azure SQL (raphcare-database on raphcare-server).
- Azure SQL was set to block all public access. The API cannot use a private-only network on the free web plan, so public access was switched to **selected networks**, with **Allow Azure services** turned on.

After that, the API reached the database. The LocalDB / public-access errors are resolved.

4. Free hosting quota (this is why the API will not start tonight)

raphcare-api and the admin site share the same free App Service plan (F1). That plan allows about 60 minutes of CPU per day.

Repeated crash-and-restart today used that quota up. Azure then shows **Start succeeded**, but the status stays **Quota exceeded** and the site does not actually run.

This is a plan limit, not another configuration miss. The daily free quota usually resets around midnight UTC. After that, start **raphcare-api** once.

The public website on Forge is separate. It is not on that Azure free quota.

Still to confirm

1. Open <https://raphcare.com> and confirm the marketing site looks right (and that mail still works).
2. Once the API is running: open the admin site and confirm the clinic list loads.
3. Send a verification email and confirm it arrives from the RaphCare mailbox.
4. Confirm Azure SQL stays on **selected networks** with **Allow Azure services** left on.

The full product status board is still the partner checklist (overall about 74%). Today did not add new patient-app screens. It moved the public website to Forge, and unblocked the hosted admin site from talking to the hosted API.

Thanks,
Daskana
