

This is the shareable list of what RaphCare does. It is grouped by who uses it:

Surface	Who it is for
Portal	Hospitals and clinics. Staff open this website for day-to-day work.
Ops	Platform owners. A separate site for wearable fleet stock and assignment.
Mobile	Patients. The phone app for day-to-day care.

It is not a progress board. Completion % lives on the partner status sheet. Use this catalog when someone asks what is in the product.

How to sell vs what you can demo. Staging shows the full hospital workspace on the Portal so a walkthrough is easy. Commercially, Clinic is the lighter outpatient set. Hospital adds beds, the counter, casualty, theatre, and the rest of the stay. The Portal headings below follow that split. Ops is not sold as a hospital plan line; it is how RaphCare (or a partner running the platform) stocks and assigns watches.

How to read status

Word	Meaning
Ready	You can walk through it today on staging.
In progress	Partly built. Do not sell it as finished.
Later	On the list. Not in the current sale.

Last reviewed: 6 September 2026

1. Portal (hospital website)

The site hospital staff open in a browser. Public landing, sign-in, and waiting screens sit here. After staff sign in and open a site, they get the clinic or hospital workspace. Opening a site hides the left menu so the tools have more room. All hospitals, language, and sign out stay in the top bar.

Staff jobs you can invite: hospital admin, doctor, nurse, pharmacist, lab technician, and general staff.

Patients can sign in on the web too, but they only get a short welcome. The full patient product is the phone app. There is no clinician phone app in this catalog.

Before you open a site

Feature	What it does	Status
Public landing	Choose patient or healthcare professional, then sign in or create an account.	Ready
Professional sign-in	Staff sign in and reach the hospital list.	Ready
Register a professional account	Create a staff account, then register or claim a hospital.	Ready

Patient sign-in on the web	Patients can sign in in the browser. After that they see a short welcome, not the full chart. Point them to the phone app for day-to-day use.	Ready
Collection waiting screen	Open on a TV or tablet at the pharmacy or lab counter. Shows pickup codes. Does not show names or medicines.	Ready
Casualty waiting screen	A second TV queue for walk-ins. Shows codes and a priority colour. Does not show names.	Ready
Languages	English, French, Lingala, and Swahili on the website.	Ready
Staff use on a phone	Same Portal website on a small screen. Top bar, forms, and tables tighten for phone and tablet. Staff can add a home-screen shortcut from the browser. Not a separate staff app.	Ready

On every site (Clinic and Hospital)

Feature	What it does	Status
Hospital list, register, claim	Find a site, register a new one, or claim one with a short RaphCare code staff can share.	Ready
Hospital profile and facilities	Edit site details. Add physical rooms or virtual locations.	Ready
Staff invites and roles	Invite people and set their job. Admins can still do hospital setup.	Ready
Patients at the site	Grant or remove access. Open the patient chart.	Ready
Patient chart	Staff can read overview, clinical, coverage, devices, and care. They do not edit the chart here.	Ready
Clinical team and schedules	Add clinicians. Set when they are available.	Ready
Appointments	Book, cancel, or reschedule.	Ready
Visits and vitals	Start a visit. Record vitals and notes. Order prescriptions and lab tests while the visit is open. Complete the visit.	Ready
Video join for staff	Start a video session from admin.	Ready
Dashboard numbers	See clinic metrics for the site.	Ready
Hospital device fleet	See watches stocked for this site, Bluetooth MAC and activated date when known, who they are assigned to, and assign an in-stock watch to a linked patient.	Ready

Extra on the Hospital plan

Beds and the collection counter sit here commercially. So do the rest of the stay and the busy front of house.

Feature	What it does	Status
Collection counter	Search by pickup code, name, or health ID. Scan a QR from the camera. Call a code onto the waiting screen. Mark a prescription collected. Enter a lab result. Cancel or undo. Print a slip or a wall poster with a QR code. Pharmacists collect medicines. Lab technicians enter results. Other staff can still do both, including after the visit is closed.	Ready
Bed board	See free, full, and maintenance beds. Wards look like a simple top-down map.	Ready

Wards, rooms, and beds	Add capacity. Edit, deactivate, or remove later. Archive when history exists.	Ready
Admit and discharge	Put a person in a free bed. Discharge them to free it.	Ready
Move a patient	Transfer an active stay to another bed.	Ready
Admission history	Look up past stays.	Ready
Ward notes	A nurse, doctor, or hospital admin can add a note, and optional heart rate, temperature, or oxygen, while the person is in a bed.	Ready
Bill at discharge	Enter a nightly bed rate and any extra charge. Print that as an invoice. Mark paid in cash.	Ready
Occupancy numbers	Occupancy %, how many people came in or left today, and average length of stay.	Ready
Nurse job	Invite someone as a nurse. They can write ward notes. They cannot document an outpatient visit.	Ready
Casualty and triage	Add a walk-in with a priority colour. Call a code onto the casualty waiting screen.	Ready
Theatre list	Put today's operations on one board. Start, complete, or cancel a case.	Ready
SafeCare on the hospital home	Recent SOS and fall alerts show on the hospital overview and the admin home. Full history stays on Devices.	Ready
Outbound referrals	Log a referral out of the hospital, then mark it accepted, completed, or cancelled.	Ready
Return visit at discharge	On discharge, optionally pick a clinician and time for the next visit before the person leaves.	Ready
Who is on today	Pick a day. See who is on Morning, Afternoon, or Night. Add or remove staff for a shift.	Ready
Draft discharge summary with AI	On discharge, start a draft when the hospital allows it. Staff edit the text, then save. The draft uses stay reason and ward vitals only, not free-text ward notes. A hospital can turn drafting off.	Ready

2. Ops (platform owners)

A separate website from the hospital Portal. Platform owners use it to stock wearables and assign them to patients. Hospital staff do not run day-to-day clinic work here. Patients claim the assigned serial in the phone app. They cannot invent one.

Feature	What it does	Status
Sign in to Ops	Platform Ops sign-in on the Ops site.	Ready
Use Ops on a phone	Same Ops site on a small screen. Top bar, stock form, and fleet list tighten for phone and tablet. Staff can add a home-screen shortcut from the browser.	Ready
Wearable fleet stock	Add a serial to stock for a hospital or RaphCare Direct. Type the code, scan packaging barcode or QR, take a picture in the browser, or choose a photo. The picture stays in the browser to help read the code. It is not uploaded.	Ready

Assign to a patient	Link a stocked device to a patient so they can claim it on the phone.	Ready
Revoke assignment	Take a watch back to stock when the patient should no longer keep it.	Ready
Delete stock device	Remove a mistaken or unused stock row. Only Ops can do this. Watches with history are retired instead of erased.	Ready
Fleet list	See devices in stock and which patient they are assigned to. Shows Bluetooth MAC and activated date when known. Revoke or delete from the same list.	Ready

3. Mobile (patient phone app)

Android is the day-to-day test target. iPhone can run the app. Video on iPhone is still catching up.

Account, home, and clinic

Feature	What it does	Status
Sign up or sign in	Email, phone code, or voice. Forgot password by email code, then a new password.	Ready
Home and navigation	Home dashboard and the main areas of the app. Upcoming visits, claimed devices, synced heart rate or oxygen, and a wellness tip from mood check-ins show when you have them.	Ready
Choose active clinic	Set which hospital this phone uses. Search finds hospitals in the directory; it is not a membership list. Or enter a short clinic code.	Ready
Settings and profile	Personal info, medical info (blood type presets; allergy and chronic chips plus Other), emergency contacts (from the phone book or typed in), privacy (honest about phone-only toggles and how to ask for deletion), help, language, and change password. Patients can add a photo from Profile or Edit Profile. Insurance badge shows the plan on file. Payment methods and billing history open the right screens. Active clinic sets which hospital this phone uses. Hospitals linked to you are listed separately from directory search.	Ready

Care and records

Feature	What it does	Status
Appointments	List, book, and open detail. Booking uses the chosen clinic and a clinician name list.	Ready
Health records	Visit notes, labs, prescriptions, and discharged stays. Waiting medicines or lab tests show a pickup code and a QR code. Scan a wall poster at the counter to show only that hospital. When staff tap Call, the app says come to the counter.	Ready
Lab result ready	When staff enter a lab result, the patient gets a notice that it is ready. The notice does not include the values. Values stay on the health record.	Ready
Request a call and join video	Ask for a call and join from the phone. Video works on Android. iPhone video still needs more setup. Confirm on a real Android handset before you treat it as a live clinic tool.	In progress
Chat assistant	Wellness questions get a reply from the hospital's cloud AI. This is not a doctor. For urgent symptoms, contact a clinician or emergency services.	Ready
Notifications list	In-app notices such as pickup called and lab ready. Real lock-screen push still needs store and server setup.	In progress

Insurance	View and add coverage.	Ready
Billing and payment methods	View bills and add a payment method. Live card or mobile-money collection is not on yet.	Ready
Family members	List, add, and open a family member.	Ready
Mental health	Mood check-in and related content. The Home tip follows recent check-ins.	Ready

Phones, alerts, and watches

Feature	What it does	Status
Android app	Build and run on Android phones.	Ready
iPhone app	The project can target iPhone. Full release checks and iPhone video are still open.	In progress
Push alerts on Android	App can register. Delivery needs Firebase on the server, then a real-device test.	In progress
Push alerts on iPhone	Needs store and push setup, then a real-device test.	In progress
Claim a watch	Patient claims the serial Ops already assigned. They can type it or photograph the packaging barcode or QR. They cannot invent a serial. Bluetooth Connect is blocked until claim, and only the locked MAC is accepted after the first pair.	Ready
E580 or E585 style band	Scan and connect after claim. Heart rate and oxygen when the band speaks those readings. Confirm on your sample watches.	In progress
Live heart rate and oxygen	Wired on Android. Hardware prove-out still needed.	In progress
Auto sync in the background	Manual sync exists. Background sync is not finished.	Later
Activity, sleep, stress	On the watches. Not in RaphCare yet.	Later
Body temperature, ECG, glucose-style screens	Documented. Not in the app yet. Optical glucose stays gated for clinical use.	Later
Y6 Pro emergency watch	SOS and fall can reach the clinic chart, the hospital Devices board, and SMS to contacts. Watch-app polish and lock-screen alerts are still open.	In progress
Play Store internal test	Android id is set. Upload in Play Console is still needed.	In progress

4. Shared pieces (behind the three surfaces)

These are not a fourth product. They make Portal, Ops, and Mobile work together.

Feature	What it does	Status
Staging demo clinic	Fake staff, a platform Ops login, and a patient on staging so you can walk the screens. Does not wipe other hospitals.	Ready
Records for other systems	Export a patient's file in a standard health format so another system can read it.	Ready

Emergency hook	An outside system can send an SOS or fall event into RaphCare.	Ready
Photos and voice files	A photo from the phone and voice sign-up audio are stored privately.	Ready
Staff mental-health assessments	A list exists for staff. Deeper storage comes later.	In progress
Reporting beyond the site dashboard	Grows with product needs.	In progress
Network (several sites)	Quoted. Shared patient index and group reporting switch on with that plan.	Later

5. On the list, not in the current sale

Ideas for after the Hospital plan board. AI would still only draft or suggest. A person always checks before anything is saved. A hospital can turn AI drafting off. We are not building US insurance form-fighting, and we are not building an AI that acts as the patient's only doctor.

Feature	What it would do	Status
Open work board	One place for overdue referrals, missed return visits, medicines not yet collected, and labs still waiting.	Later
Visit or ward note draft with AI	Start text from vitals and stay facts. Staff edit.	Later
Reminders for visits and pickup	In-app first. Text or call later when the site is set up for that.	Later
Plain-language help on labs and vitals	The phone chat explains results and band readings in simple words, and tells people to ask their clinician when unsure.	Later
Casualty priority hint	Suggest a colour from the complaint and vitals. Staff confirm.	Later
Discharge checklist on the phone	After leaving: medicines, return visit, and warning signs in plain language.	Later
Imaging report draft	Optional partner link for X-ray style drafts. A radiologist edits.	Later

Clinic vs Hospital (commercial reminder)

Plan	What they get
Clinic	One site. Outpatient admin, appointments, visits, patient chart. Up to 8 staff.
Hospital	Everything in Clinic, plus beds, ward notes, collection counter, waiting screens, discharge invoice, occupancy, casualty, theatre, outbound referrals, nurse job, roster, return visit at discharge, and AI discharge draft. Up to 25 staff.
Network	Several sites. Quoted. Shared patient index and reporting as we switch that on.

Patients use the phone app. Hospital staff use the Portal. Platform owners use Ops for wearable fleet. There is no clinician phone app in this catalog.

Prices sit on the separate price list.
